U.S. Government Rights

The Software is "commercial computer software," as defined by Federal Acquisition Regulation ("FAR") 2.101. Pursuant to FAR 12.212 and 27.405-3 and Department of Defense FAR Supplement ("DFARS") 227.7202, the U.S. government acquires commercial computer software under the same terms by which the software is customarily provided to the public. Accordingly, Keysight provides the Software to U.S. government customers under its standard commercial license, which is embodied in its End User License Agreement (EULA), a copy of which can be found at www.keysight.com/find/sweula. The license set forth in the EULA represents the exclusive authority by which the U.S. government may use, modify, distribute, or disclose the Software. The EULA and the license set forth therein, does not require or permit, among other things, that Keysight: (1) Furnish technical information related to commercial computer software or commercial computer software documentation that is not customarily provided to the public; or (2) Relinquish to, or otherwise provide, the government rights in excess of these rights customarily provided to the public to use, modify, reproduce, release, perform, display, or disclose commercial computer software or commercial computer software documentation. No additional government requirements beyond those set forth in the EULA shall apply, except to the extent that those terms, rights, or licenses are explicitly required from all providers of commercial computer software pursuant to the FAR and the DFARS and are set forth specifically in writing elsewhere in the EULA. Keysight shall be under no obligation to update, revise or otherwise modify the Software. With respect to any technical data as defined by FAR 2.101, pursuant to FAR 12.211 and 27.404.2 and DFARS 227.7102, the U.S. government acquires no greater than Limited Rights as defined in FAR 27.401 or DFAR 227.7103-5 (c), as applicable in any technical data.

Declaration of Conformity

Declarations of Conformity for this product and for other Keysight products may be downloaded from the Web. Go to <http://www.keysight.com/go/conformity>.

Regulatory Symbols

The CE mark shows that the product complies with all applicable European Directives.

The RCM mark is a registered trademark of the Australian Communications and Media Authority.

ICES/NMB-001

This ISM device complies with Canadian ICES-001.

Cet appareil ISM est conforme à la norme NMB-001 du Canada.

ISM GROUP 1 CLASS A

This is the symbol for an Industrial, Scientific and Medical, Group 1 Class A product.

The CSA mark is a registered trademark of Intertek-ettlsemko Inc.

This is the RoHS (Restriction of Hazardous Substances) symbol for electrical and electronic equipment.

South Korean Class A EMC Declaration

This equipment has been conformity assessed for use in business environments. In a residential environment this equipment may cause radio interference. This EMC statement applies to the equipment only for use in business environments.

This symbol indicates separate collection for electrical and electronic equipment mandated under EU law as of August 13, 2005. All electric and electronic equipment are required to be separated from normal waste for disposal (Reference WEEE Directive 2002/96/EC).

Where to Find More Information

This document provides specification and supplemental characteristic information for the following instruments:

- Keysight N6731B through N6792A Power and Load Modules
- Keysight N6700C-series and N6705C Mainframes

For additional technical details and ordering information for the Keysight N6700 Modular Power System Family, refer to the following:

| Power Module Differences: Keysight N6700C Modular Power Systems | 8 |
| Power Module Differences: Keysight N6705C DC Power Analyzers | 11 |

This chapter provides a brief overview of the basic differences between the Keysight N6700 series DC Power Modules. Note that the basic capabilities of a power module depend not only on its hardware capabilities, but also on the hardware and firmware capabilities of the mainframe in which it is installed.

In addition to their primary output and measurement capabilities, power modules installed in a Keysight N6705C DC Power Analyzer have expanded capabilities such as front panel scope view, arbitrary waveform generation, and internal and external data logging.

Refer to the Keysight N6700C or N6705C User's Guide for more information about the power module capabilities.

Power Module Option Characteristics

Option 760 & 761

Option 761 provides output and sense disconnect relays. Option 760 provides polarity reversal in addition to output and sense disconnect. Note that models N678xA SMU have output and sense disconnect relays built in.

- Option 760 limits the output current to 10 A on Models N6742B and N6773A.

- Option 760 is not available on Models N6741B, N6751A, N6752A, N6761A, N6762A, and N6781A – N6786A

Although the plus and minus rail of the output power mesh are physically disconnected from the output terminals with options 760 and 761, a small AC network is still connected across the plus and minus output terminals (see figure).

Option 054

Option 054 (High-speed Test Extensions) include output list and digitized measurement capability. This option is separately orderable for Models N673xB, N674xB, N677xA, and N675xA when installed in an N6700 MPS mainframes. All other power modules as well as the N6705 DC Power Analyzer mainframes have output list and digitized measurement capability built in.

Output list:

- Maximum number of steps = 512
- Maximum dwell time in seconds = 262
- Maximum list repetitions = 256 or infinite

Digitized measurement:

- Maximum measurement points = 524,288
- Maximum sample rate = 97.656 kHz

Option 2UA

Option 2UA is a 200 microampere measurement range available on Models N6761A and N6762A only. It includes Option 761 relay capability.

Option SMR

Option SMR is seamless measurement autoranging for Model N6784A. It is included with Models N6781A, N6782A, N6785A, and N6786A.

Unless otherwise noted, specifications are warranted over the ambient temperature range of 0 to 40°C after a 30-minute warm-up period.
Unless otherwise noted, accuracy is specified as percent of value + fixed offset.

Specifications apply at the output terminals, with each module's sense terminals internally connected to its output terminals (local sensing).

Refer to the Keysight N6700 or N6705 Service Guide for the setup conditions for all performance specifications.

Supplemental characteristics are not warranted but are descriptions of performance determined either by design or by type testing. All supplemental characteristics are typical unless otherwise noted.

¹ Output current is derated 1% per °C above 40°C.

² When relay option 760 is installed on Models N6742B and N6773A, the output current is limited to 10 A.

³ When relay option 760 or 761 is installed, the settling band is ±0.10V/0.125 V.

Option 760 is not available on Model N6741B.

⁴ When relay option 760 or 761 is installed, the settling band is ±0.35 V.

Output Quadrant Characteristic

Arbitrary Waveform Generator Maximum Bandwidth

NOTE

The information in this section only applies when the power modules are installed in a Keysight N6705 DC Power Analyzer.

The following tables characterize the maximum bandwidth of the arbitrary waveform generator. The maximum bandwidth is based on a sine wave into a resistive load and applies to any output current. The following definitions apply in the frequency tables:

- V p-p = Voltage peak-to-peak
- 3 dB max. = Max. frequency where the voltage drops to 3 dB below its setting
- 6 dB max. = Max. frequency where the voltage drops to 6 dB below its setting
- THD 3 dB = The total harmonic distortion at 3 dB max. frequency
- THD 6 dB = The total harmonic distortion at 6 dB max. frequency

¹ Correction On compensates for current flowing into the output capacitor during voltage transients.

² Stated values apply when the load resistance is at or close to zero. To determine the frequency for larger resistance values, refer to the User's Guide under "Measurement System Bandwidth".

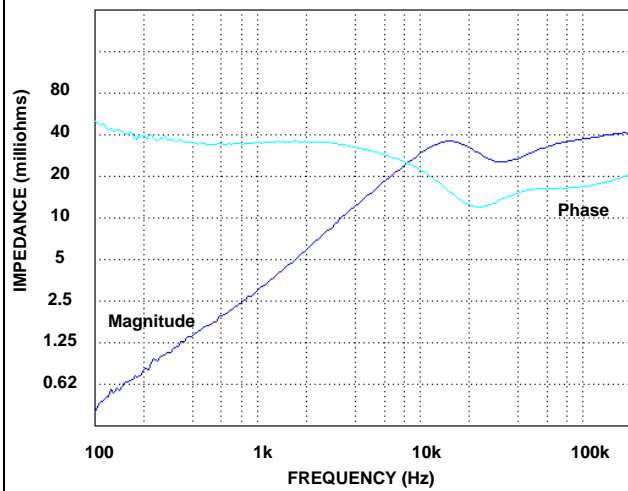

³ Modules can discharge the specified capacitive load from full scale to 0V at a rate of 4 times/second.

Arbitrary Waveform Generator Maximum Bandwidth

NOTE

The information in this section only applies when the power modules are installed in a Keysight N6705 DC Power Analyzer.

The following tables characterize the maximum bandwidth of the arbitrary waveform generator. The maximum bandwidth is based on a sine wave into a resistive load and applies to any output current. The following definitions apply in the frequency tables:

- V_{p-p} = Voltage peak-to-peak
3 dB max. = Max. frequency where the voltage drops to 3 dB below its setting
THD 3 dB = The total harmonic distortion at 3 dB max. frequency
THD < 1.5% = The frequency below which the THD is less than 1.5%.

| Voltage | 3 dB max | THD 3 dB | THD < 1.5% |

¹ Output current is derated 1% per °C above 40°C.

² Applies when measuring currents that remain within the low range. Due to thermal settling, when transitioning from measuring full-rated output current (the worst case), to measuring the current within the low range, the low range accuracy specification is typically met within 5 seconds after the current has transitioned into the low range. Accuracies within this 5 second settling period are typically 2X the specified accuracy or better.

³ When relay option 760 or 761 is installed on Models N6763A and N6765A, the settling band is \pm 200 mV.

⁴ When relay option 760 or 761 is installed on Models N6764A and N6766A, the settling band is \pm 350 mV.

| peak-to-peak | < 2 mA | < 2 mA | < 3 mA |
| Remote Sense Capability: | | | |
| Outputs can maintain specifications with up to a 1-volt drop per load lead. The load lead drop reduces the maximum available voltage at the load. | | | |
| Series and Parallel Operation: | | | |
| Identically rated outputs can be operated directly in parallel or can be connected for straight series operation. | | | |
| Minimum Output Turn-On Delay: (Time from when any Output On command is received until the output starts turning on) | | | |
| Without relay option | 32 ms ^{NOTE 5} | 18 ms | 18 ms |
| With relay Option 760 | 58 ms ^{NOTE 5} | 44 ms | 44 ms |

¹ If you are operating the unit below 255 μ A in constant current mode, the output may become unregulated with the following load conditions: The load resistance is <175 m Ω and the load inductance is >20 μ H. If this occurs, an UNRegulated flag will be generated and the output current may rise above the programmed value but will remain < 255 μ A.

² Correction On compensates for current flowing into the output capacitor during voltage transients

³ Stated values apply when the load resistance is at or close to zero. To determine the frequency for larger resistance values, refer to the User's Guide under "Measurement System Bandwidth".

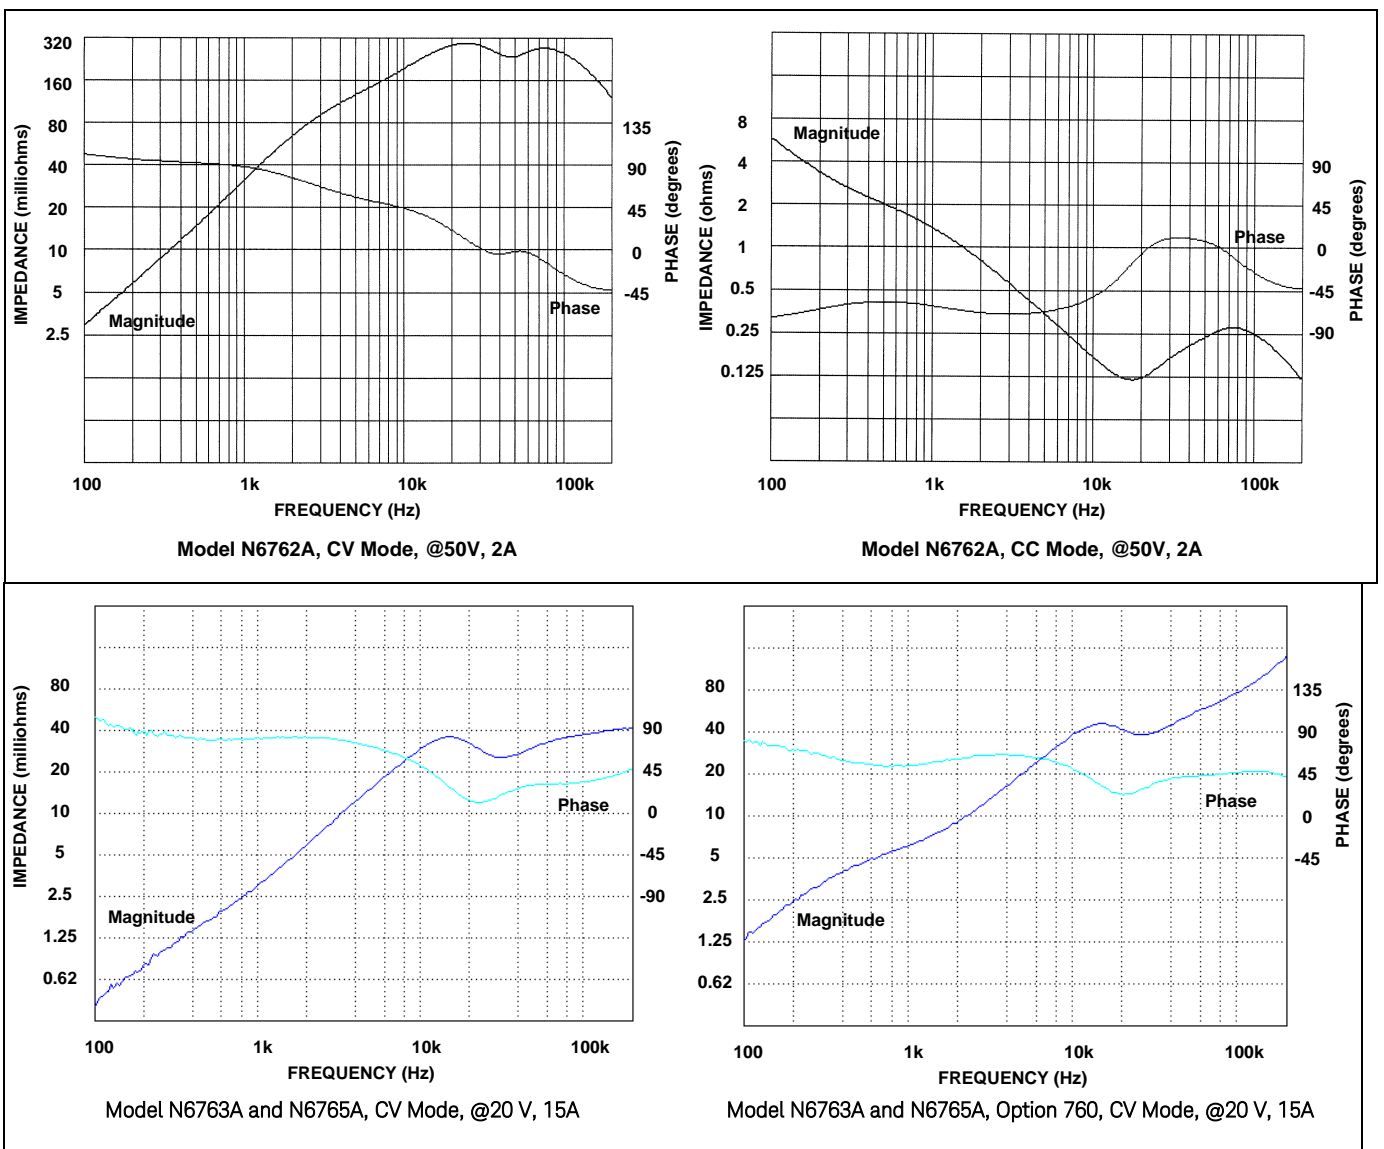

⁴ Modules can discharge the specified capacitive load from full scale to 0V at a rate of 4 times/second.

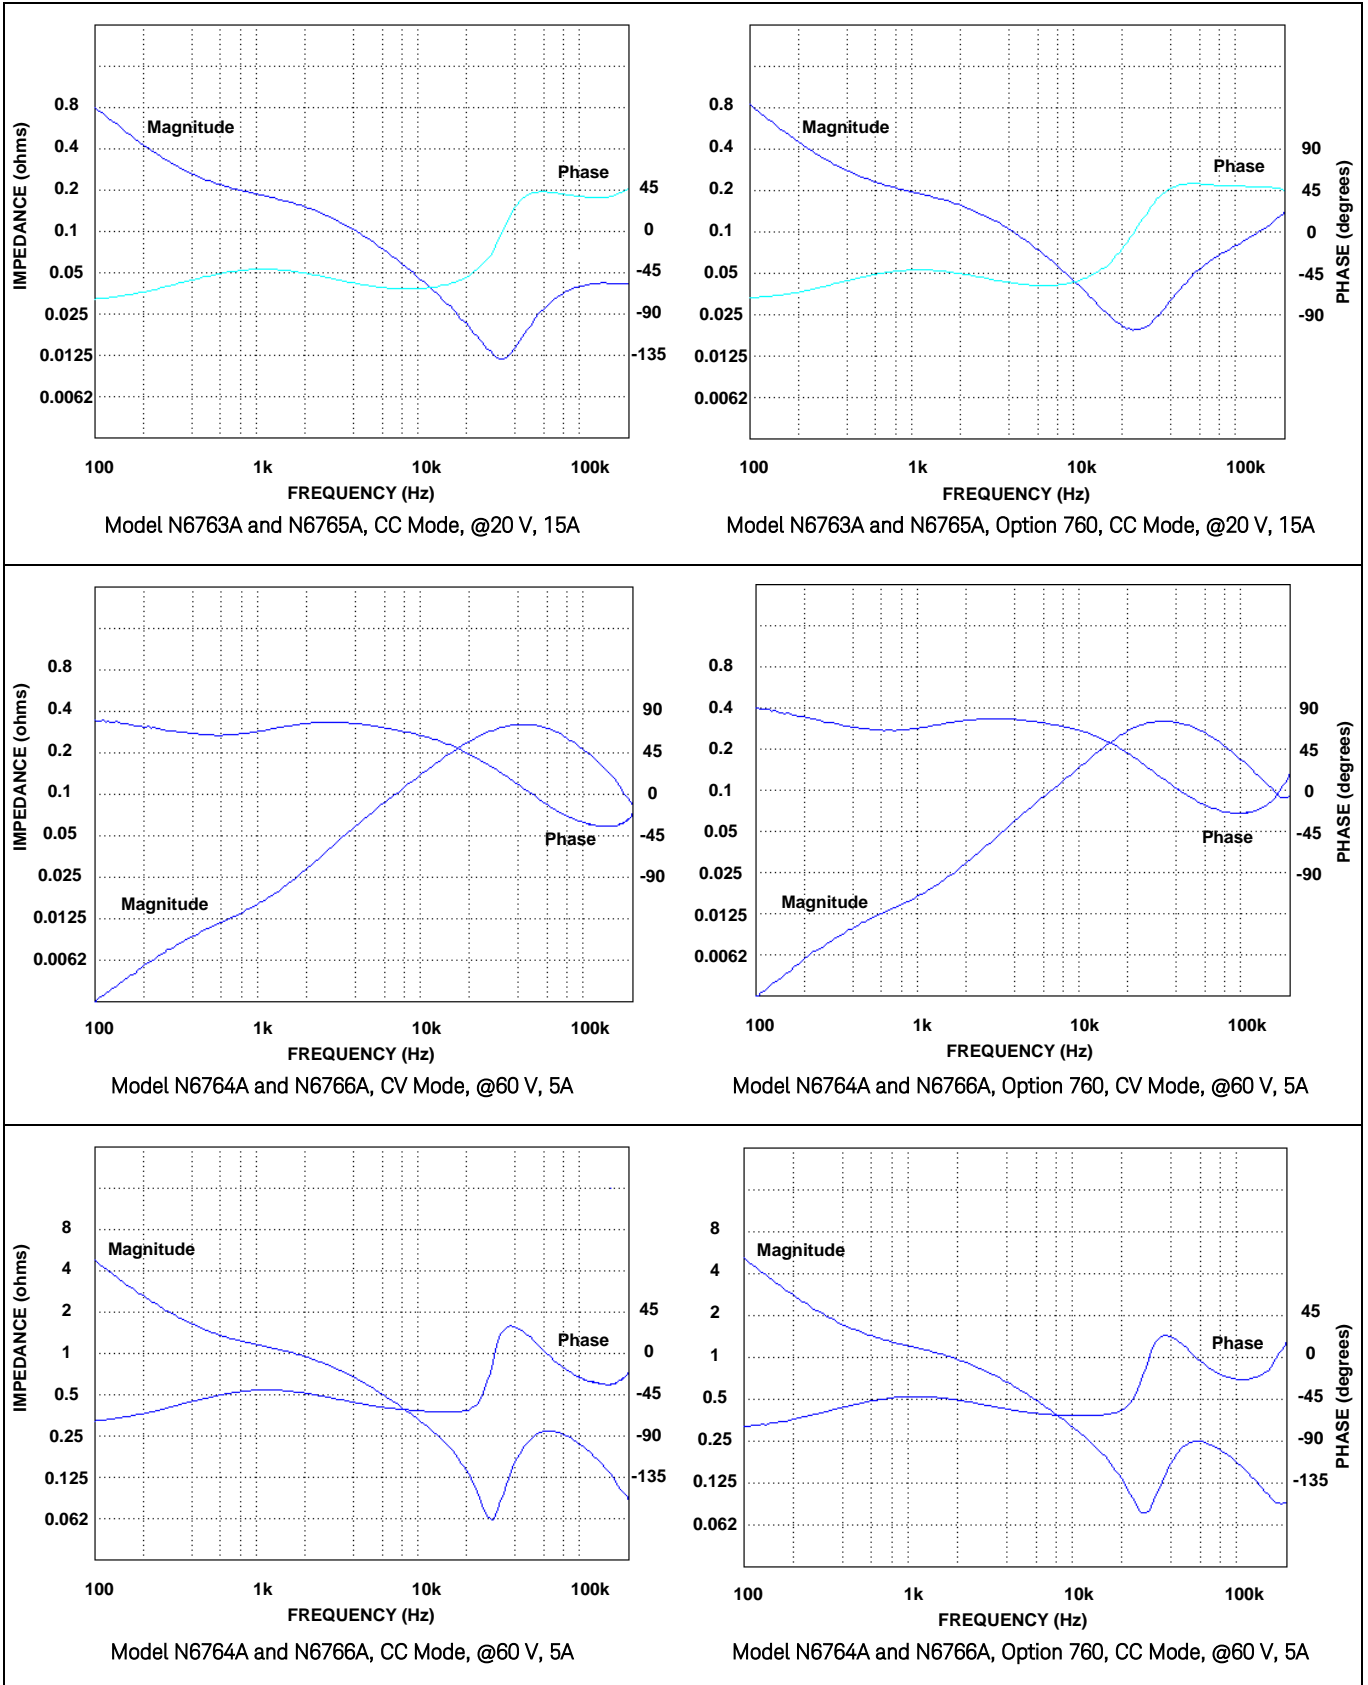

⁵ In Current turn-on preferred mode, minimum delay is 23 ms without relays and 45 ms with relay Option 760.

Arbitrary Waveform Generator Maximum Bandwidth

NOTE

The information in this section only applies when the power modules are installed in a Keysight N6705 DC Power Analyzer.

The following tables characterize the maximum bandwidth of the arbitrary waveform generator. The maximum bandwidth is based on a sine wave into a resistive load and applies to any output current. The following definitions apply in the frequency tables:

- V_{p-p} = Voltage peak-to-peak
3 dB max. = Max. frequency where the voltage drops to 3 dB below its setting
THD 3 dB = The total harmonic distortion at 3 dB max. frequency
THD < 1.5% = The frequency below which the THD is less than 1.5%.

| Voltage | 3 dB max | THD 3 dB | THD < 1.5% |

Unless otherwise noted, specifications are warranted over the ambient temperature range of 0 to 30°C after a 30-minute warm-up period.
Unless otherwise noted, accuracy is specified as percent of value + fixed offset.

Unless otherwise noted, specifications apply at the mainframe output terminals, with each module's sense terminals internally connected to its output terminals (local sensing).

Refer to the Keysight N6700 or N6705 Service Guide for the setup conditions for all performance specifications.

Supplemental characteristics are not warranted but are descriptions of performance determined either by design or by type testing. All supplemental characteristics are typical unless otherwise noted.

¹ Applies to N6781A and N6785A only

² For N6785A and N6786A applies with a 0 - 4 V step.

³ Response time applies from the occurrence of the over-voltage condition to the start of output shutdown.

⁴ In CV priority mode, uneven current sharing while paralleling prevents using the lower current measurement ranges and will also cause degradation in transient response performance.

Output Quadrant Characteristic

Note 1. When sinking power, Keysight Model N6784A can operate at the maximum rated output power for only a limited time. When the internal temperature of the unit exceeds its safe limit, the output latches off. A protect clear is required to resume normal operation. The condition is annunciated by the OT status bit. The Downprogrammer derating figure shows the safe limit boundary values.

Measurement Accuracy and Resolution (with shorter measurement intervals)

The following table shows changes to the short-term measurement accuracy and resolution with various number of power line cycle (NPLC) measurement settings. Changes are due to the A-to-D converter's noise performance. The table's baseline is 1 NPLC with no added noise. To determine the measurement accuracy at shorter averaging intervals, simply add the noise value to the fixed accuracy value in the specification table.

| Performance Specifications..... | 54 |
| Supplemental Characteristics | 55 |
| Output Quadrant Characteristic | 56 |

Unless otherwise noted, specifications are warranted over the ambient temperature range of 0 to 40°C after a 30-minute warm-up period. Unless otherwise noted, accuracy is specified as percent of value + fixed offset.

Specifications apply at the output terminals, with each module's sense terminals internally connected to its output terminals (local sensing).

Refer to the Keysight N6700 or N6705 Service Guide for the setup conditions for all performance specifications.

Supplemental characteristics are not warranted but are descriptions of performance determined either by design or by type testing. All supplemental characteristics are typical unless otherwise noted.

NOTE

Keysight N6791A and N6792A Electronic Load Modules **are not supported** on the following previous Keysight mainframes: N6701A, N6702A, N6700B, N6705A, and N6705B.

Unless otherwise noted, specifications are warranted over the ambient temperature range of 0 to 40°C after a 30-minute warm-up period. Unless otherwise noted, accuracy is specified as percent of value + fixed offset.

Specifications apply at the output terminals, with each module's sense terminals internally connected to its output terminals (local sensing).

Refer to the Keysight N6700 or N6705 Service Guide for the setup conditions for all performance specifications.

Supplemental characteristics are not warranted but are descriptions of performance determined either by design or by type testing. All supplemental characteristics are typical unless otherwise noted.

¹ Maximum continuous power is derated linearly from 100% of maximum @ 40 °C to 75% of maximum @ 55 °C.

² Based on minimum operating resistance, 0.08 Ω for 100W and 0.04 Ω for 200W. This means that below 1.6 V, the rated current decreases linearly based on the rate of the respective minimum operating resistance.
